

QUICK CARD

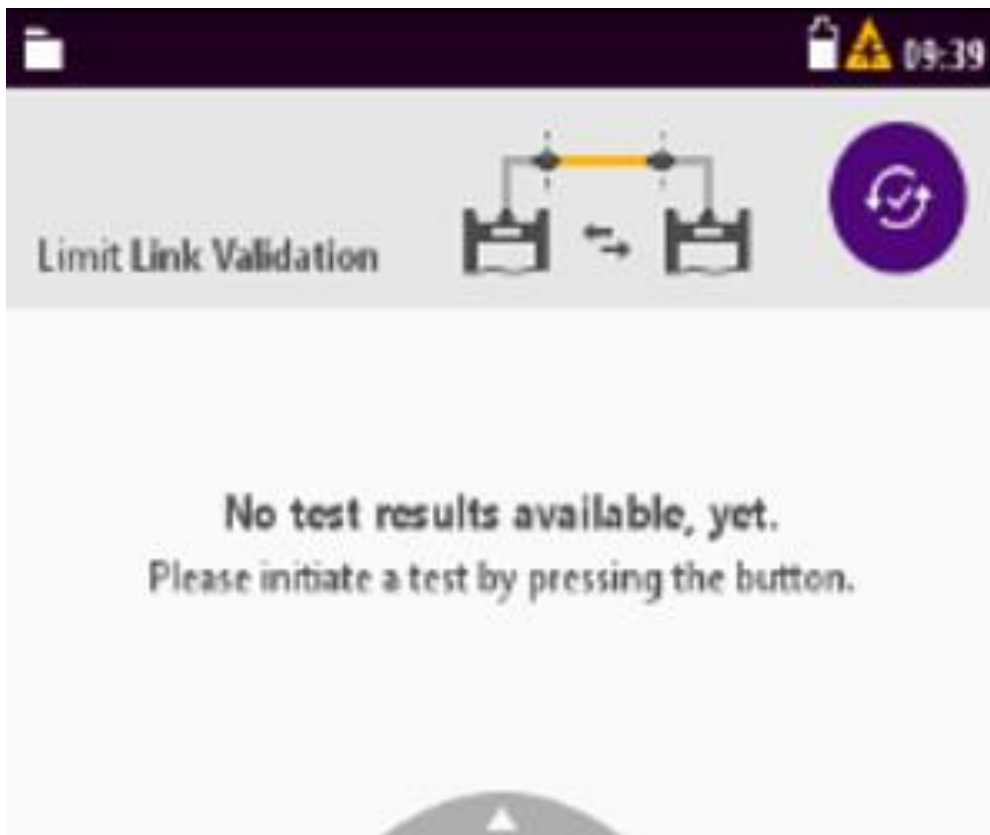

Notes:

- Use reference grade cords to ensure lowest loss per connector
- Use inspection scope (INX-760 recommended) to ensure all connectors to MPOLx and FUT are clean and undamaged

- Pay attention to unpinned and pinned connections (MPOLx connector is always pinned)

- Access the reference menu by pressing the button from the main testing screen shown here:

QUICK CARD

Setting Reference: Step 1

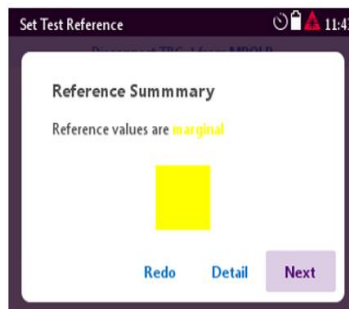

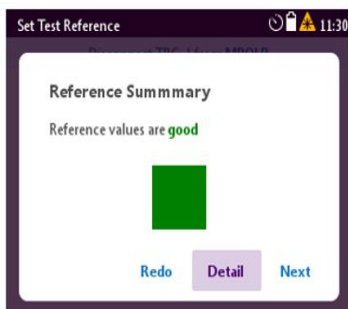

IMPORTANT: Inspect and, if necessary, clean all TRCs

Connect the MPOLP to the MPOLS using an **UNPINNED-to-UNPINNED** MTP Pro connectorized test reference cord (TRC-1) as shown below.

Setting Reference: Step 2

- If reference values are good or marginal, proceed to Step 3
- If reference values are bad, press the “Detail” button to see the individual dBm values per fiber

The screenshot shows the 'Set Test Reference > Details' screen, which displays a table of reference values in dBm for 12 fibers. The table has columns for Fiber number, 1310 nm, and 1550 nm. The values are as follows:

Fib.	1310	1550	Fib.	1310	1550
1	-5.62	-5.84	7	-5.69	-6.10
2	-5.90	-6.17	8	-6.01	-6.10
3	-6.33	-5.99	9	-5.97	-6.03
4	-6.06	-6.06	10	-5.91	-5.95
5	-5.94	-6.52	11	-5.98	-6.15
6	-5.91	-5.83	12	-6.34	-6.36

- *Acceptable Single-mode referencing values should be better than (less negative) -7dBm*
- *All values need to be uniform and within 1dB between the highest and lowest values*
- *Reference Summary is a guide – Use your judgment. Yellow and Red do not necessarily mean you cannot proceed*

QUICK CARD

Verifying the Reference: Step 3

IMPORTANT: Do not disconnect the TRC from the MPOLS

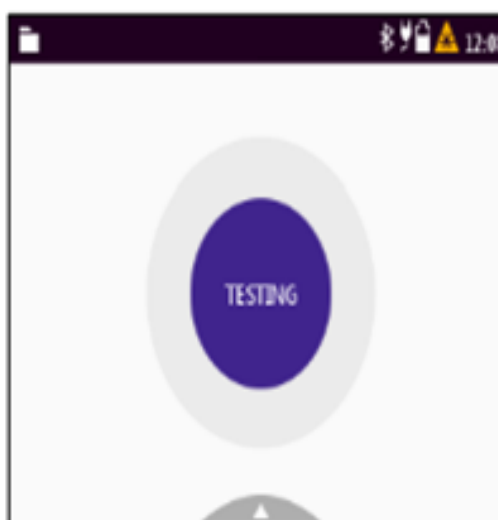

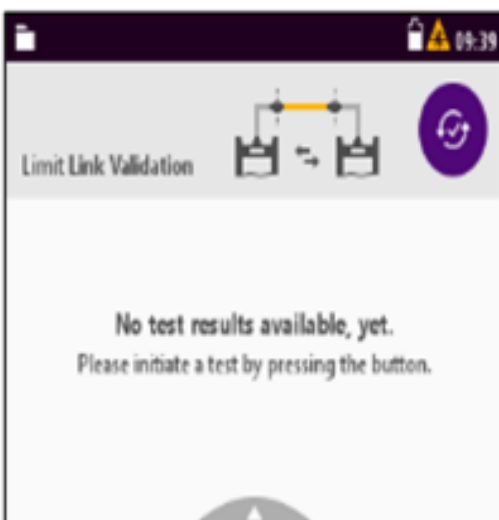

- Disconnect test reference cord (TRC-1) from the **MPOLP ONLY** and add pins using the MTP POR tool
- Insert an **UNPINNED-to-PINNED** TRC (TRC-2) into the MPOLP. The **UNPINNED** end into the **MPOLP**
- Connect the MPOLS (TRC-1) to the MPOLP (TRC-2) using an **UNPINNED-to-UNPINNED MTP PRO** connectorized test reference cord (TRC-3) as shown below

QUICK CARD

Verifying the Reference: Step 4

- Once the three TRCs are in place, press “Done” and then press “Test”
- The test will verify the condition of TRC-2 and ensure that you are only testing the “fiber under test”
- Test limits for reference verification tests are **0.70dB**

QUICK CARD

The MPOLx is Ready For Testing!!!

- Once the three TRCs are in place, press “Done” and then press “Test”
- The test will verify the condition of TRC-2 and ensure that you are only testing the “fiber under test”
- Test limits for reference verification tests are **0.70dB**
