

# Referencing and Testing **UNPINNED** **12 Fiber MM MPO APC Links**

With the Viavi MPOLx

November 2025

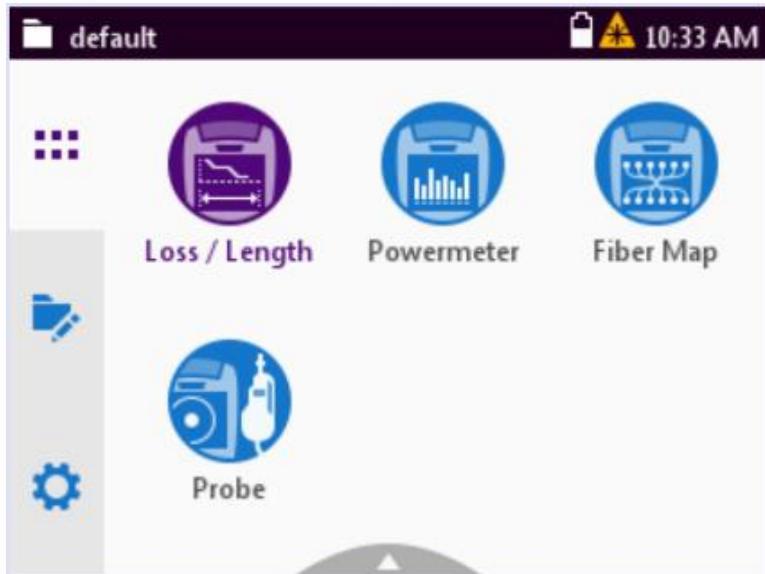

# Link Testing of **UNPINNED** Multimode Links

With Adapter Cord Reference Method  
Specific to 12 Fiber **UNPINNED** MPO **APC** Terminated Links

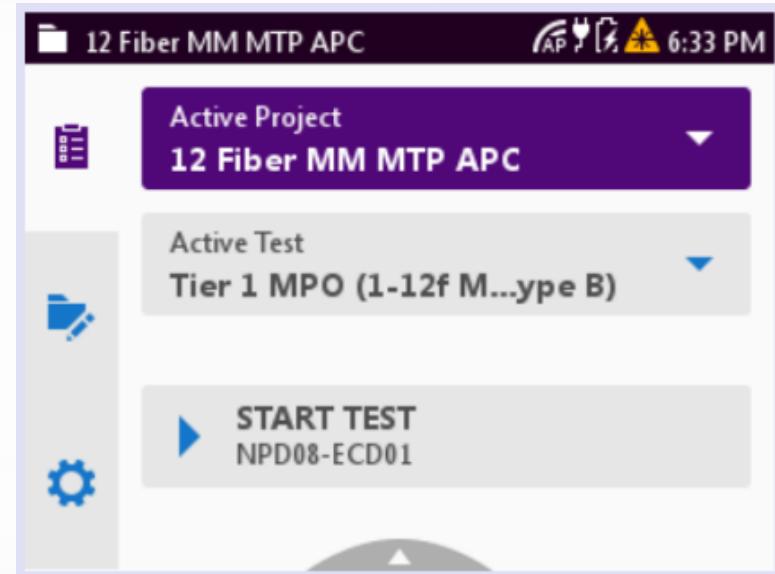

# When powered on, the home screen layout is based on the active project type

Default layout is Test Tool Mode

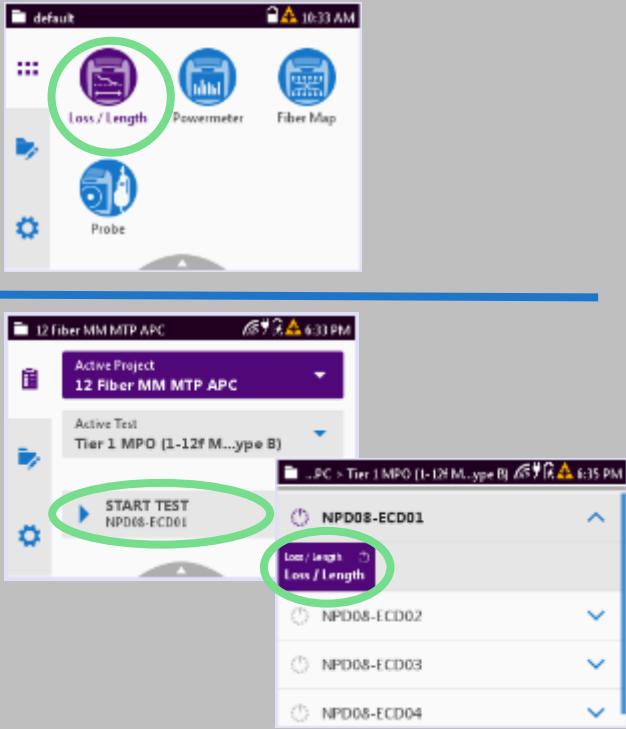

Workflow/Test Process Automation Mode

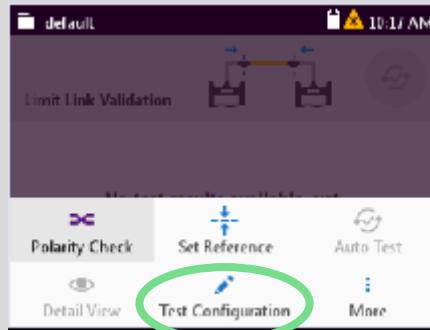

# The default Reference Wizard (guide) does not pertain to this test configuration and must be turned off in Test Configuration

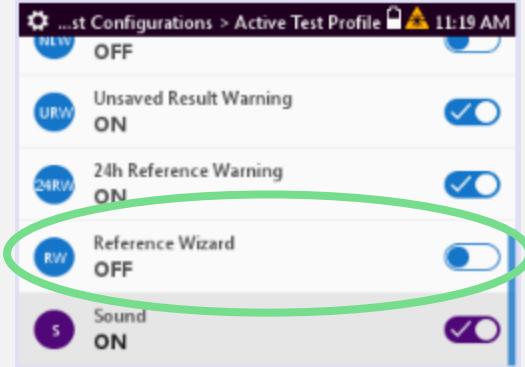

- Click on Loss / Length icon or START TEST

- Click on the Menu button

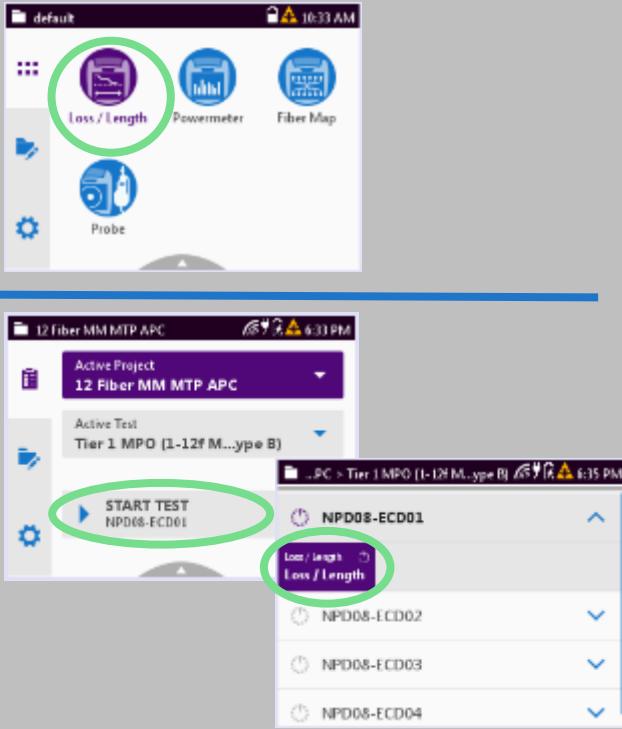

- Create a new test configuration or go to the Active Test Profile and scroll down to turn Reference Wizard OFF

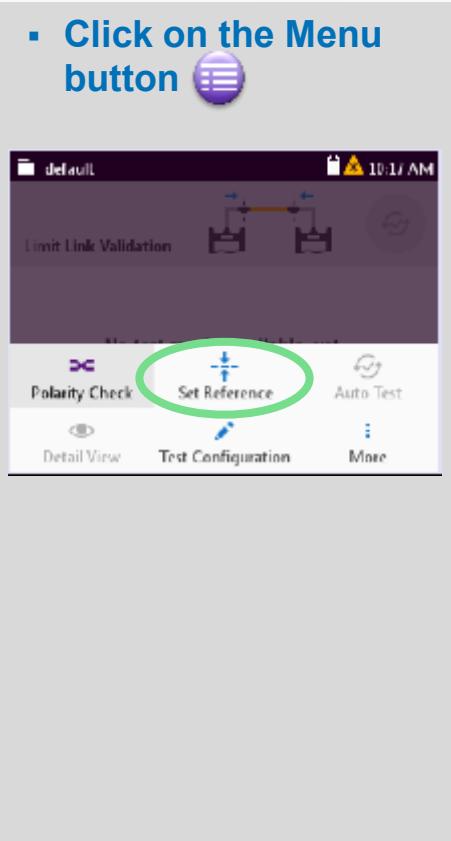

# Go to Set Reference to begin the referencing process

- Click on Loss / Length icon or START TEST

- Click on the Menu button

- FOLLOW THE STEP BY STEP PROCESS TO PERFORM A ONE JUMPER REFERENCE, REFERENCE VERIFICATION, AND TO BEGIN TESTING

# Required Test Cords

## Adapter Cord Reference Method

For testing  
12 fiber MM  
UNPINNED  
MPO APC  
Type B  
Links

All test reference cords (TRCs) must be “low attenuation grade” with a mated pair loss of 0.35dB or less

- TC1 (launch cord): MM **UPC**-unpinned to **APC**-unpinned, Polarity B
- TC2 (receive cord): MM **UPC**-unpinned to **APC**-pinned, **Polarity A**
- TC3 (adapter cord): MM **APC**-pinned to **APC**-pinned, Polarity B, length  $\leq$  2m
- SC1 (substitution/verification cord): MM **APC**-unpinned to **APC**-unpinned, Polarity B

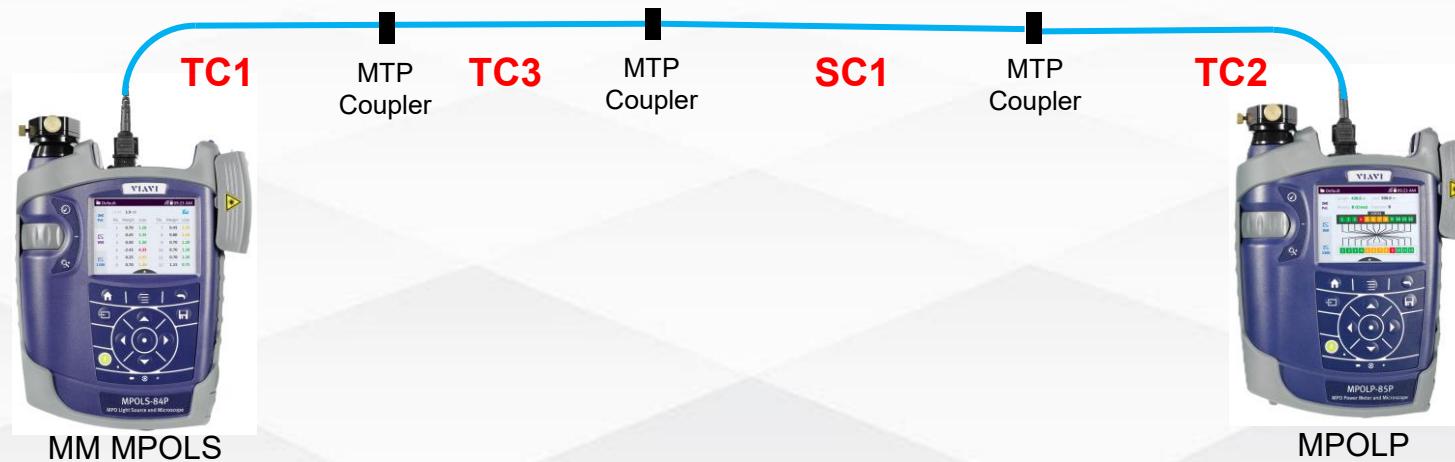

*Based on the size of your project, it is extremely important to have multiple sets of TRCs on hand.*

For reference: An MPO connector is rated for 500 mating cycles, however how the TRCs are cared for can impact that number either way

# Test cords required for Link testing?

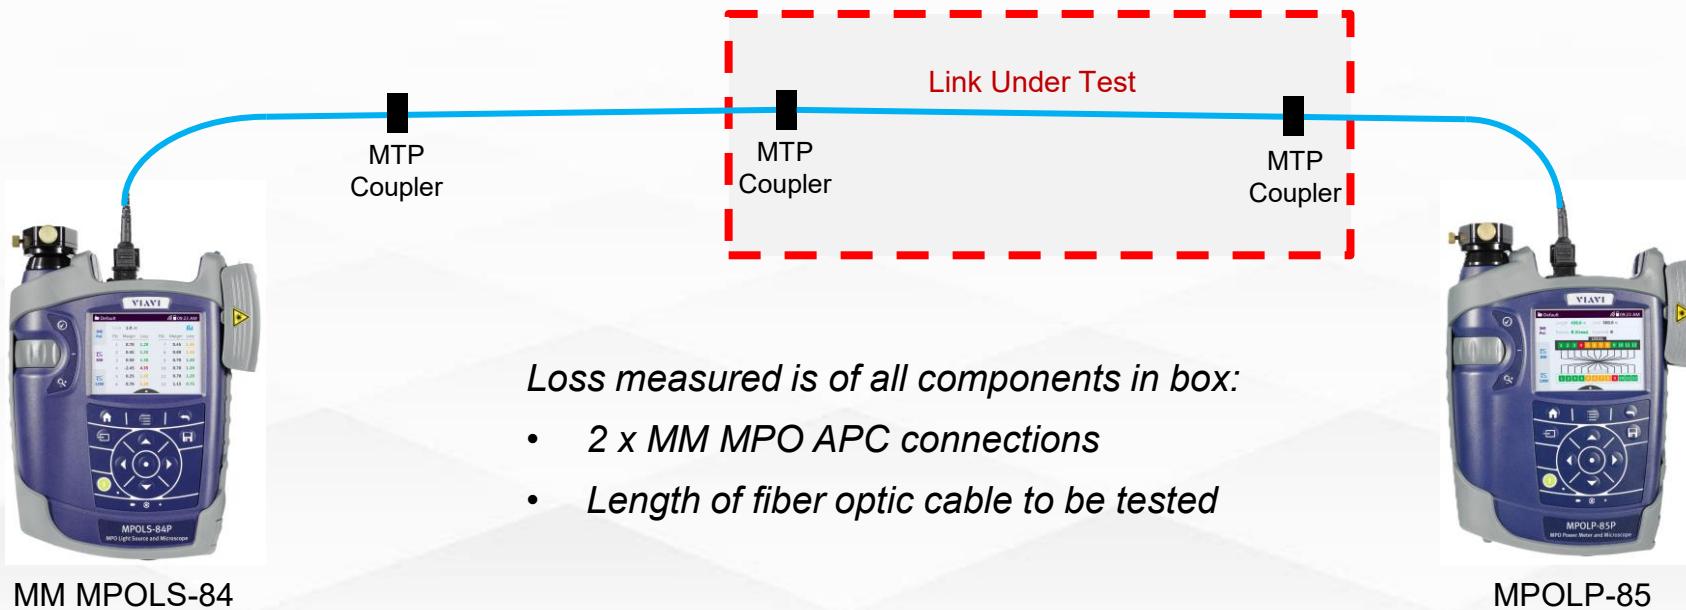

All test reference cords (TRCs) must be “low attenuation grade” – mated pair loss of 0.35dB or less

- TC1 (launch cord): MM PC-unpinned to APC-unpinned, Polarity B
- TC2 (receive cord): MM PC-unpinned to APC-pinned, Polarity A
- TC3 (adapter cord): MM APC-pinned to APC-pinned, Polarity B
- SC1 (substitution/verification cord): MM APC-unpinned to APC-unpinned, Polarity B

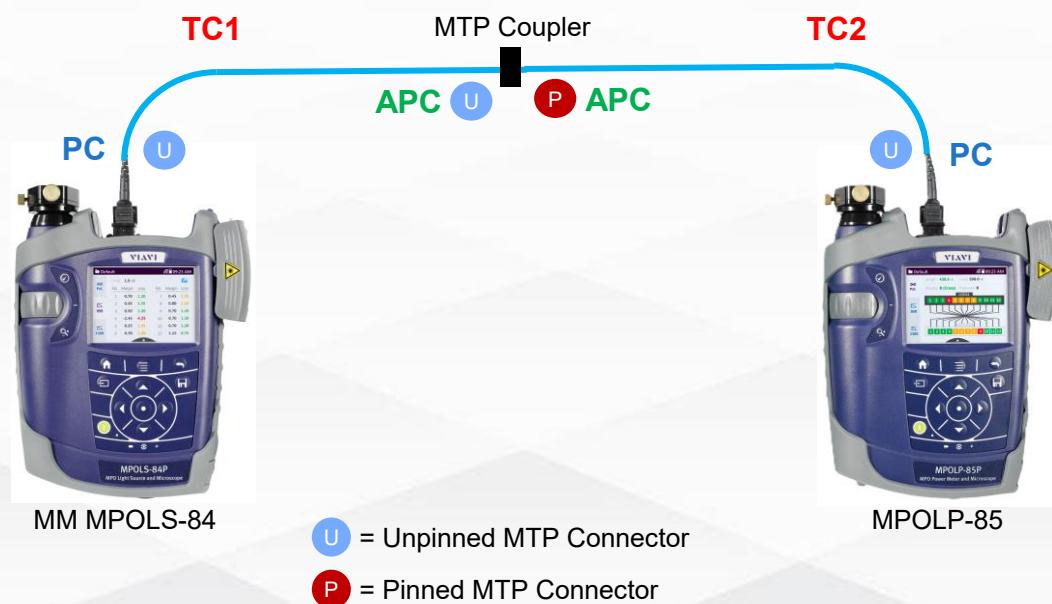

# What needs to be tested?

Link tests need to **include** the loss between the test cords and the link under test

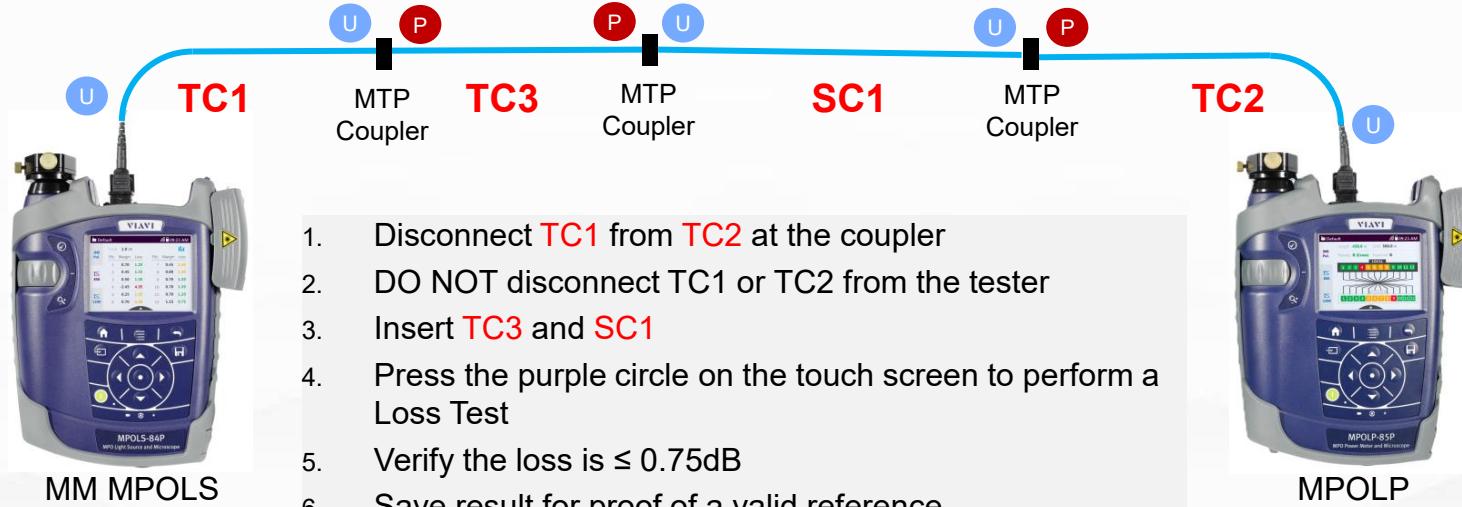

# Step 1: Set the Reference

- **Turn off the Reference Wizard** - the default wizard (on screen guide) does not apply to this reference configuration. See previous slide for instructions on how to turn this feature off.
- Connect the MPOLS-84 to the MPOLP-85 using TC1, an MPO coupler, and TC2 as shown below
- Set the reference

# Step 2: Reference Verification

*It is recommended, if not required, to save the results of this test for confirmation*

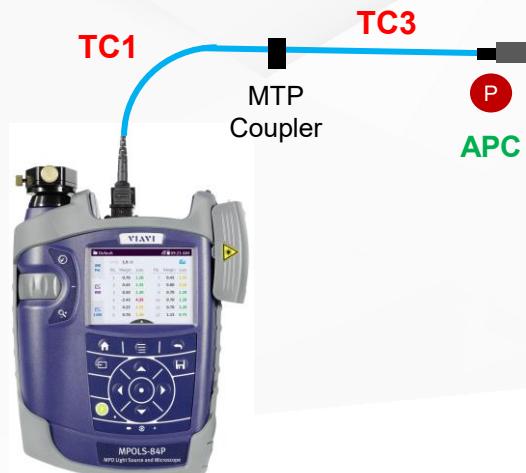

- TC1 (launch cord): MM PC-unpinned to APC-unpinned, Polarity B
- TC2 (receive cord): MM PC-unpinned to APC-pinned, **Polarity A**
- TC3 (adapter cord): MM APC-pinned to APC-pinned, Polarity B
- SC1 (substitution/verification cord): MM APC-unpinned to APC-unpinned, Polarity B

U = Unpinned MTP Connector

P = Pinned MTP Connector

# You are now ready to begin testing!

- Remove the two MTP couplers and **SC1**
- Connect **TC3** and **TC2** to the fiber link to be tested
- Test and save your results

### To import the test data into ReportPRO

- Simply connect the MPOLP to a laptop running ReportPRO with a USB cable
- Select “Test Results” from the drop down menu list
- Select  Import Instrument to import the test data off the MPOLP
- Select  Import StrataSync to import the test data stored in StrataSync

### To import the test data into ReportPRO

- Simply connect the MPOLP to a laptop running ReportPRO with a USB cable
- Select “Test Results” from the drop down menu lis

**Viavi's Test Process Automation (TPA) makes it simple to configure test equipment and generate close out reports faster**
